List of illustrations xv

1 Introduction 1
1.1 Classical versus high-dimensional theory 1
1.2 What can go wrong in high dimensions? 2
1.2.1 Linear discriminant analysis 2
1.2.2 Covariance estimation 5
1.2.3 Nonparametric regression 7
1.3 What can help us in high dimensions? 9
1.3.1 Sparsity in vectors 10
1.3.2 Structure in covariance matrices 11
1.3.3 Structured forms of regression 12
1.4 What is the non-asymptotic viewpoint? 14
1.5 Overview of the book 15
1.5.1 Chapter structure and synopses 15
1.5.2 Recommended background 17
1.5.3 Teaching possibilities and a flow diagram 17
1.6 Bibliographic details and background 19

2 Basic tail and concentration bounds 21
2.1 Classical bounds 21
2.1.1 From Markov to Chernoff 21
2.1.2 Sub-Gaussian variables and Hoeffding bounds 22
2.1.3 Sub-exponential variables and Bernstein bounds 25
2.1.4 Some one-sided results 31
2.2 Martingale-based methods 32
2.2.1 Background 33
2.2.2 Concentration bounds for martingale difference sequences 35
2.3 Lipschitz functions of Gaussian variables 40
2.4 Appendix A: Equivalent versions of sub-Gaussian variables 45
2.5 Appendix B: Equivalent versions of sub-exponential variables 48
2.6 Bibliographic details and background 49
2.7 Exercises 50

3 Concentration of measure 58
3.1 Concentration by entropic techniques 58
3.1.1 Entropy and its properties 58
3.1.2 Herbst argument and its extensions 60

Published online by Cambridge University Press

3.1.3 Separately convex functions and the entropic method 62
3.1.4 Tensorization and separately convex functions 64
3.2 A geometric perspective on concentration 67
3.2.1 Concentration functions 67
3.2.2 Connection to Lipschitz functions 70
3.2.3 From geometry to concentration 72
3.3 Wasserstein distances and information inequalities 76
3.3.1 Wasserstein distances 76
3.3.2 Transportation cost and concentration inequalities 78
3.3.3 Tensorization for transportation cost 80
3.3.4 Transportation cost inequalities for Markov chains 82
3.3.5 Asymmetric coupling cost 84
3.4 Tail bounds for empirical processes 87
3.4.1 A functional Hoeffding inequality 87
3.4.2 A functional Bernstein inequality 89
3.5 Bibliographic details and background 91
3.6 Exercises 92

4 Uniform laws of large numbers 98
4.1 Motivation 98
4.1.1 Uniform convergence of cumulative distribution functions 98
4.1.2 Uniform laws for more general function classes 101
4.2 A uniform law via Rademacher complexity 104
4.2.1 Necessary conditions with Rademacher complexity 107
4.3 Upper bounds on the Rademacher complexity 109
4.3.1 Classes with polynomial discrimination 109
4.3.2 Vapnik–Chervonenkis dimension 111
4.3.3 Controlling the VC dimension 115
4.4 Bibliographic details and background 117
4.5 Exercises 117

5 Metric entropy and its uses 121
5.1 Covering and packing 121
5.2 Gaussian and Rademacher complexity 132
5.3 Metric entropy and sub-Gaussian processes 134
5.3.1 Upper bound by one-step discretization 135
5.3.2 Some examples of discretization bounds 137
5.3.3 Chaining and Dudley's entropy integral 139
5.4 Some Gaussian comparison inequalities 143
5.4.1 A general comparison result 143
5.4.2 Slepian and Sudakov–Fernique inequalities 145
5.4.3 Gaussian contraction inequality 146
5.5 Sudakov's lower bound 148
5.6 Chaining and Orlicz processes 150
5.7 Bibliographic details and background 153
5.8 Exercises 154

6 Random matrices and covariance estimation 159
6.1 Some preliminaries 159

Published online by Cambridge University Press

6.1.1 Notation and basic facts 159
6.1.2 Set-up of covariance estimation 160
6.2 Wishart matrices and their behavior 161
6.3 Covariance matrices from sub-Gaussian ensembles 165
6.4 Bounds for general matrices 168
6.4.1 Background on matrix analysis 168
6.4.2 Tail conditions for matrices 169
6.4.3 Matrix Chernoff approach and independent decompositions 172
6.4.4 Upper tail bounds for random matrices 174
6.4.5 Consequences for covariance matrices 179
6.5 Bounds for structured covariance matrices 180
6.5.1 Unknown sparsity and thresholding 180
6.5.2 Approximate sparsity 183
6.6 Appendix: Proof of Theorem 6.1 185
6.7 Bibliographic details and background 188
6.8 Exercises 189

7 Sparse linear models in high dimensions 194
7.1 Problem formulation and applications 194
7.1.1 Different sparsity models 194
7.1.2 Applications of sparse linear models 196
7.2 Recovery in the noiseless setting 199
7.2.1 ℓ_1-based relaxation 200
7.2.2 Exact recovery and restricted nullspace 200
7.2.3 Sufficient conditions for restricted nullspace 202
7.3 Estimation in noisy settings 206
7.3.1 Restricted eigenvalue condition 207
7.3.2 Bounds on ℓ_2-error for hard sparse models 209
7.3.3 Restricted nullspace and eigenvalues for random designs 213
7.4 Bounds on prediction error 216
7.5 Variable or subset selection 218
7.5.1 Variable selection consistency for the Lasso 219
7.5.2 Proof of Theorem 7.21 222
7.6 Appendix: Proof of Theorem 7.16 224
7.7 Bibliographic details and background 227
7.8 Exercises 229

8 Principal component analysis in high dimensions 236
8.1 Principal components and dimension reduction 236
8.1.1 Interpretations and uses of PCA 237
8.1.2 Perturbations of eigenvalues and eigenspaces 241
8.2 Bounds for generic eigenvectors 242
8.2.1 A general deterministic result 242
8.2.2 Consequences for a spiked ensemble 245
8.3 Sparse principal component analysis 248
8.3.1 A general deterministic result 249
8.3.2 Consequences for the spiked model with sparsity 252
8.4 Bibliographic details and background 255
8.5 Exercises 256

Published online by Cambridge University Press

9	**Decomposability and restricted strong convexity**	259
9.1	A general regularized M-estimator	259
9.2	Decomposable regularizers and their utility	269
	9.2.1 Definition and some examples	269
	9.2.2 A key consequence of decomposability	272
9.3	Restricted curvature conditions	276
	9.3.1 Restricted strong convexity	277
9.4	Some general theorems	279
	9.4.1 Guarantees under restricted strong convexity	280
	9.4.2 Bounds under Φ^*-curvature	284
9.5	Bounds for sparse vector regression	286
	9.5.1 Generalized linear models with sparsity	286
	9.5.2 Bounds under restricted strong convexity	287
	9.5.3 Bounds under ℓ_∞-curvature conditions	288
9.6	Bounds for group-structured sparsity	290
9.7	Bounds for overlapping decomposition-based norms	293
9.8	Techniques for proving restricted strong convexity	297
	9.8.1 Lipschitz cost functions and Rademacher complexity	298
	9.8.2 A one-sided bound via truncation	302
9.9	Appendix: Star-shaped property	306
9.10	Bibliographic details and background	306
9.11	Exercises	307
10	**Matrix estimation with rank constraints**	312
10.1	Matrix regression and applications	312
10.2	Analysis of nuclear norm regularization	317
	10.2.1 Decomposability and subspaces	317
	10.2.2 Restricted strong convexity and error bounds	319
	10.2.3 Bounds under operator norm curvature	320
10.3	Matrix compressed sensing	321
10.4	Bounds for phase retrieval	326
10.5	Multivariate regression with low-rank constraints	329
10.6	Matrix completion	330
10.7	Additive matrix decompositions	337
10.8	Bibliographic details and background	341
10.9	Exercises	343
11	**Graphical models for high-dimensional data**	347
11.1	Some basics	347
	11.1.1 Factorization	347
	11.1.2 Conditional independence	350
	11.1.3 Hammersley–Clifford equivalence	351
	11.1.4 Estimation of graphical models	352
11.2	Estimation of Gaussian graphical models	352
	11.2.1 Graphical Lasso: ℓ_1-regularized maximum likelihood	353
	11.2.2 Neighborhood-based methods	359
11.3	Graphical models in exponential form	365
	11.3.1 A general form of neighborhood regression	366
	11.3.2 Graph selection for Ising models	367

Published online by Cambridge University Press

11.4 Graphs with corrupted or hidden variables 368
11.4.1 Gaussian graph estimation with corrupted data 368
11.4.2 Gaussian graph selection with hidden variables 373
11.5 Bibliographic details and background 376
11.6 Exercises 378

12 Reproducing kernel Hilbert spaces 383
12.1 Basics of Hilbert spaces 383
12.2 Reproducing kernel Hilbert spaces 385
12.2.1 Positive semidefinite kernel functions 386
12.2.2 Feature maps in $\ell^2(\mathbb{N})$ 387
12.2.3 Constructing an RKHS from a kernel 388
12.2.4 A more abstract viewpoint and further examples 390
12.3 Mercer's theorem and its consequences 394
12.4 Operations on reproducing kernel Hilbert spaces 400
12.4.1 Sums of reproducing kernels 400
12.4.2 Tensor products 403
12.5 Interpolation and fitting 405
12.5.1 Function interpolation 405
12.5.2 Fitting via kernel ridge regression 407
12.6 Distances between probability measures 409
12.7 Bibliographic details and background 411
12.8 Exercises 412

13 Nonparametric least squares 416
13.1 Problem set-up 416
13.1.1 Different measures of quality 416
13.1.2 Estimation via constrained least squares 417
13.1.3 Some examples 418
13.2 Bounding the prediction error 420
13.2.1 Bounds via metric entropy 425
13.2.2 Bounds for high-dimensional parametric problems 427
13.2.3 Bounds for nonparametric problems 429
13.2.4 Proof of Theorem 13.5 430
13.3 Oracle inequalities 432
13.3.1 Some examples of oracle inequalities 434
13.3.2 Proof of Theorem 13.13 437
13.4 Regularized estimators 439
13.4.1 Oracle inequalities for regularized estimators 439
13.4.2 Consequences for kernel ridge regression 439
13.4.3 Proof of Corollary 13.18 443
13.4.4 Proof of Theorem 13.17 444
13.5 Bibliographic details and background 448
13.6 Exercises 449

14 Localization and uniform laws 453
14.1 Population and empirical L^2-norms 453
14.1.1 A uniform law with localization 454
14.1.2 Specialization to kernel classes 458

Published online by Cambridge University Press

14.1.3 Proof of Theorem 14.1 460
14.2 A one-sided uniform law 462
14.2.1 Consequences for nonparametric least squares 466
14.2.2 Proof of Theorem 14.12 468
14.3 A uniform law for Lipschitz cost functions 469
14.3.1 General prediction problems 469
14.3.2 Uniform law for Lipschitz cost functions 472
14.4 Some consequences for nonparametric density estimation 475
14.4.1 Density estimation via the nonparametric maximum likelihood estimate 475
14.4.2 Density estimation via projections 477
14.5 Appendix: Population and empirical Rademacher complexities 480
14.6 Bibliographic details and background 481
14.7 Exercises 482

15 Minimax lower bounds 485
15.1 Basic framework 485
15.1.1 Minimax risks 486
15.1.2 From estimation to testing 487
15.1.3 Some divergence measures 489
15.2 Binary testing and Le Cam's method 491
15.2.1 Bayes error and total variation distance 491
15.2.2 Le Cam's convex hull method 497
15.3 Fano's method 500
15.3.1 Kullback–Leibler divergence and mutual information 501
15.3.2 Fano lower bound on minimax risk 501
15.3.3 Bounds based on local packings 503
15.3.4 Local packings with Gaussian entropy bounds 506
15.3.5 Yang–Barron version of Fano's method 512
15.4 Appendix: Basic background in information theory 515
15.5 Bibliographic details and background 518
15.6 Exercises 519
